

# Lab-On-Chip based protein profiling for CANcer DI Agnosis

NanoBIO 2008

Barcelona, 10th of June of 2008

Manuel Marcelino Perez Perez

NanoBioEuroep 2008. Barcelona 10-06-2008

Funded by EC contract FP6-034202

# Cancer diagnosis

- Blood test/single biomarker

- Imaging analysis X-rays, CT scans...

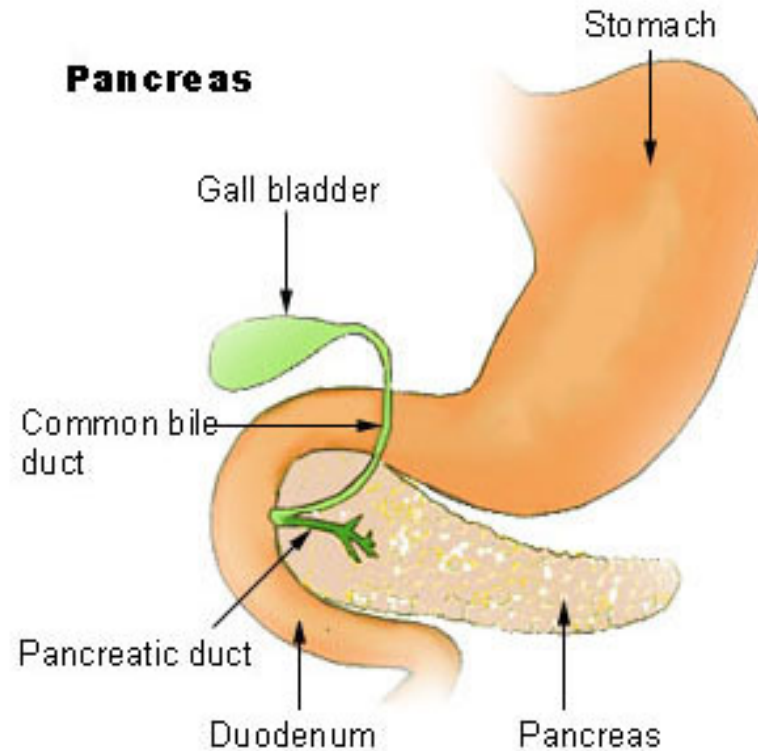

Figure 3 – Thoracic CT scan (pulmonary window) - several nodules (suggestive of metastases)

- Histological examination

# Pancreatic cancer

- The pancreas

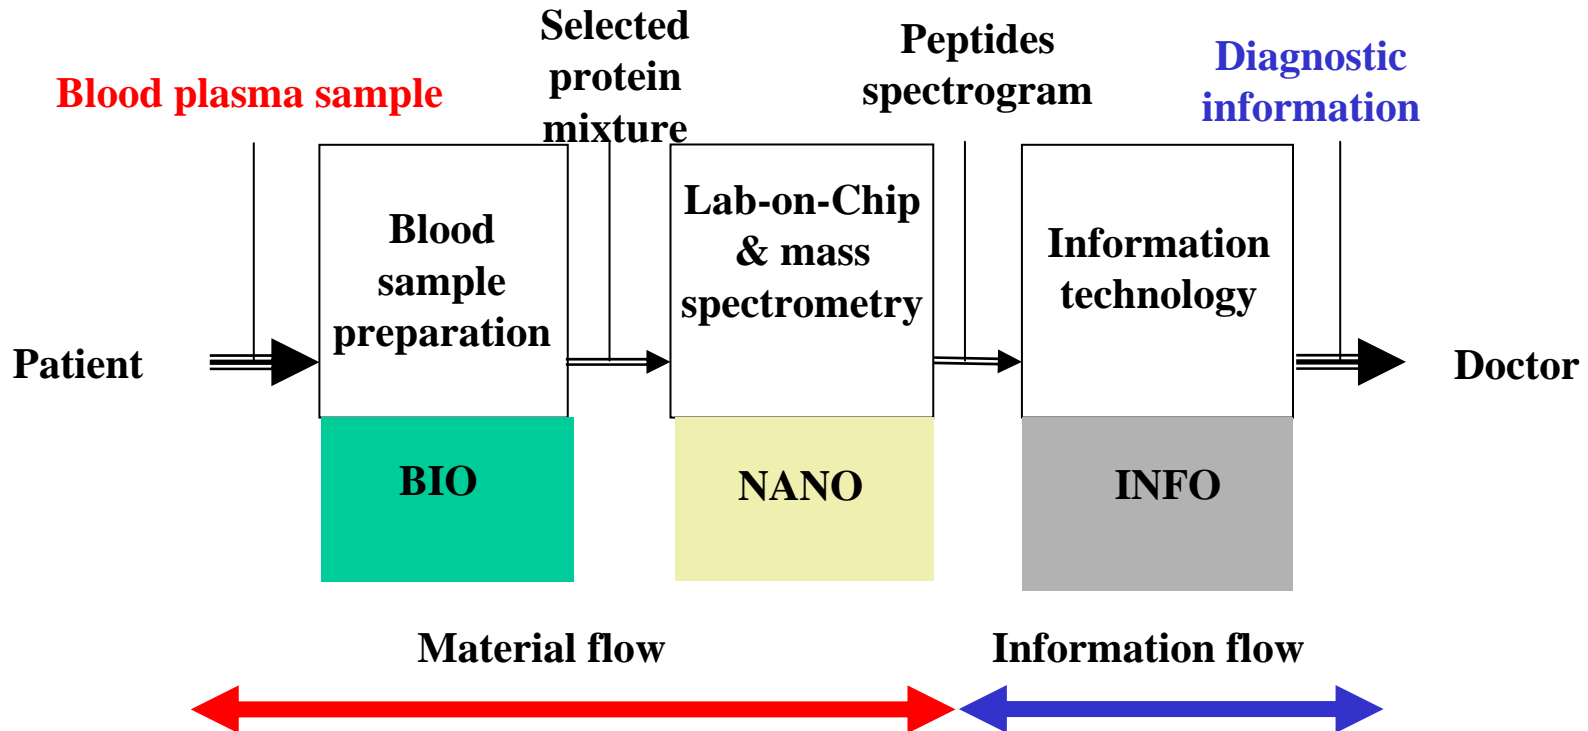

- Poor prognosis at the time of diagnosis
- Detected by expensive diagnostic imaging methods.

# Project goals

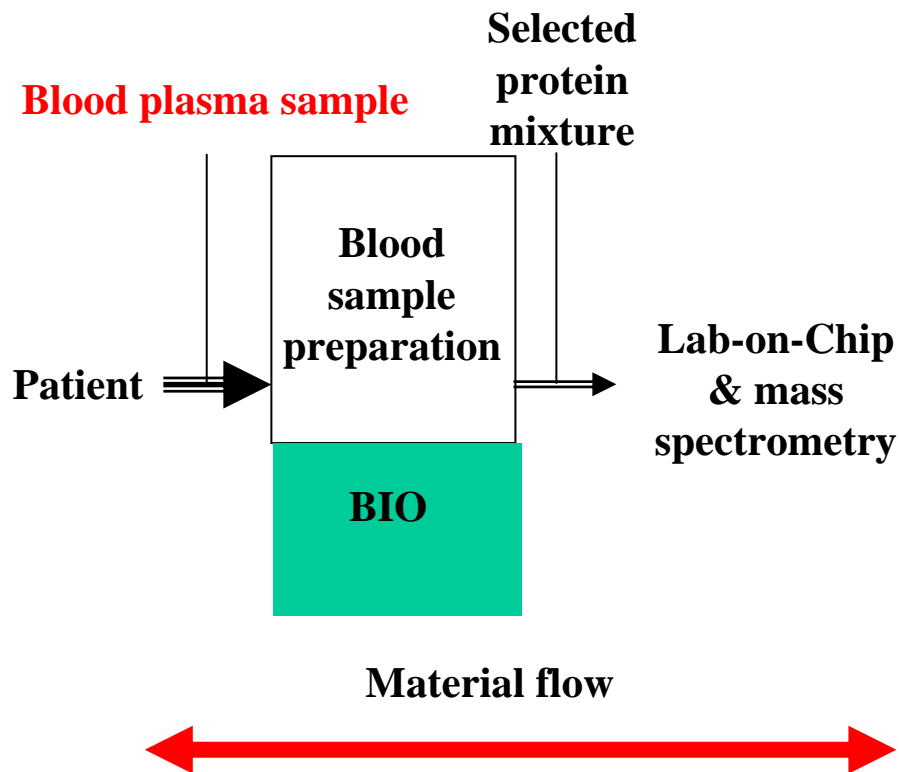

- To develop a full analysis chain integrating bio-nano and info aspects for early detection of pancreatic cancer.
- To develop a lab-on-chip for separation and digestion of proteins.
- To test the full analytical chain for early detection of asymptomatic pancreatic cancer patients.

- To be able to determine **low concentration** cancer markers in the window of classic cancer marker
  - Targeted concentration range: 1 to 1000 pmole/L or 1 to 1000 ng/mL
- To **quantify a multiparametric set of markers** to improve the measurement specificity
- To **use chromatography nano-columns** to improve the sensitivity
- To **use electrospray ionisation** for a soft on-line ionisation
- To use a **mass spectrometry characterisation**:
  - to get a specific, sensitive and semi-quantitative recognition
  - to distinguish isoforms when the sensitivity is appropriate

# LOCCANDIA project

# Bio part (I)

- Preparation of proteins to make synthetic mixtures using standards protocol.
- Production of the specific antibodies.
- Design of the affinity columns and the quality control of the proteins using MALDI-MS.

- MRP8/14, PAP I & p120
- Proteins purification
- Antibodies design and production.

PAP1  
purified protein

Anti-PAP1 antibodies  
detect PAP1

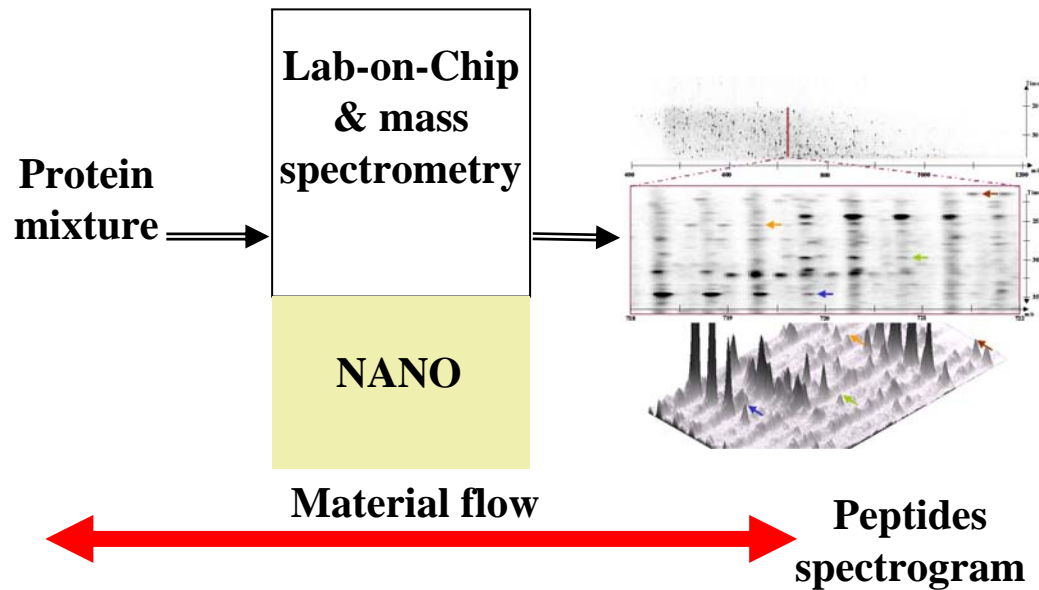

Antibodies detect PAP1 in pancreas  
tumor cell (immunofluorescence)

# Lab-on-chip & mass spectrometry

• The objectives are:

- to improve the digestion chip
- to improve the chromatography-electrospray microsystem technology

• Two interconnected modules are designed:

- a protein digestion module
- a liquid chromatography-electrospray ionisation module

- Toward a point of care :

Full system from blood plasma sample to diagnostic information

- Lab-on-Chip

Miniaturized integrated components to increase sensitivity (nano-LC, nano-ESI) and throughput

# Lab-on-chip.

- Improvements of the digestion modules.

– Design of a new nano-liquid chromatography (LC) module including a new e-spray tip.

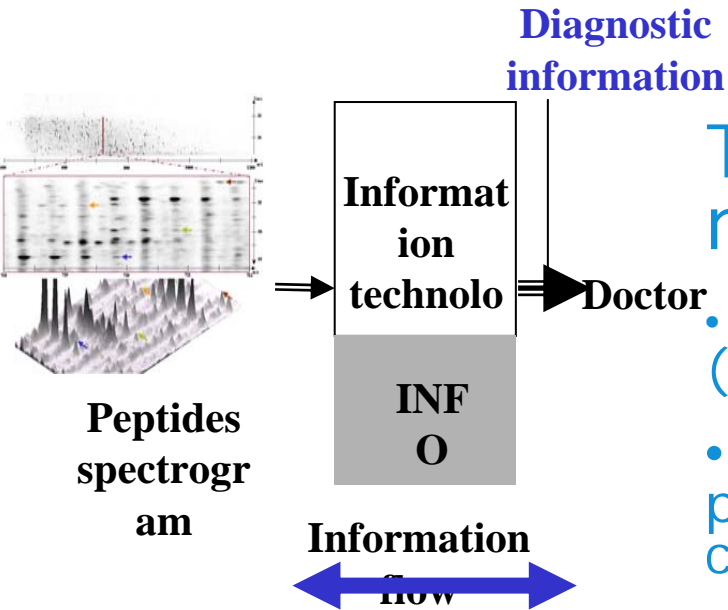

– New retention phase for chromatography module

# Interface with Mass Spectrometry

Chip mounting for Waters Q-TOF mass spectrometer

To build LOCCANDIA information management system (LIMS):

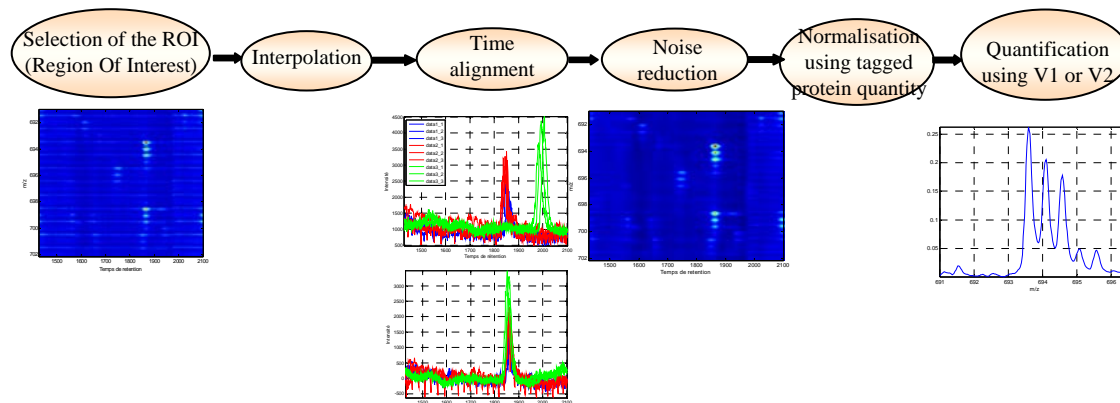

- a Proteomic Information Management System (PIS) for sample information management
- a Clinical Information System (CIS) for patient information management to allow clinical evaluation

Information and data mediation infrastructure including preprocessing, reconstruction, visualization, protein/peptide identification and data analysis modules

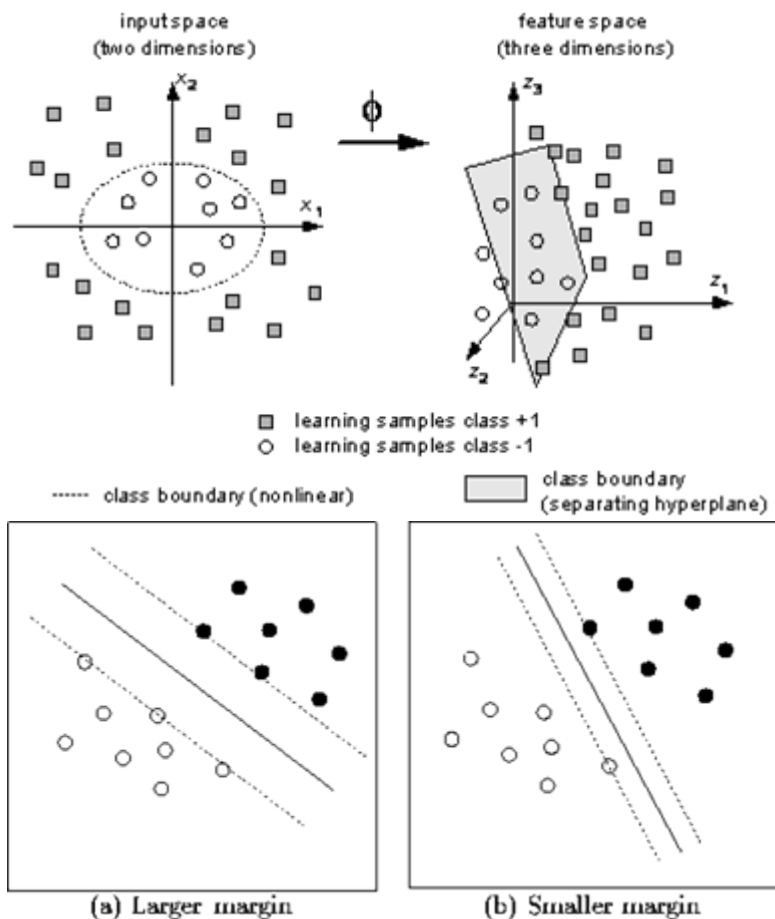

# LIMS modules

To build an Integrated a Clinico-Proteomic Information System (CPIS) for sample information management:

- a Data pre-processing & Profile reconstruction module

- an Information and data mediation infrastructure including preprocessing, reconstruction, visualization, protein/peptide identification and data analysis modules

Source: [www.neural-forecasting.com](http://www.neural-forecasting.com)

Example: Mapping from two-dimensional input space with non-linear class boundaries into a three-dimensional feature space with linear separation by hyperplane. Working in high dimensional feature space solves the problem of expressing complex functions.

Support Vectors

# SVM GAUSSIAN RADIAL BASIS KERNEL

Gaussian Radial Basis kernel function.

Number of Support Vectors : 20  
Training error : 0

SVM classification plot

**Verification:** We build  
the product RIGHT

**Validation:** We build the  
RIGHT product

# Main research outcomes LOCCANDIA

- an optimized chromatographic-electrospray lab-on-chip dedicated to protein profiling for cancer diagnosis
- an Integrated Clinico-Proteomics Environment supporting the integrated device and the diagnosis
- a proof-of-concept of this innovative lab-on-chip technology and the associated analysis chain for cancer diagnosis

# STRENGTHS & OPPORTUNITIES

## • STRENGTHS

- Manipulation of sample volumes in the nanoliter range.
- High sensitivity
- Gel free analytical chain
- Advanced biomedical informatics systems
- Miniaturization of protein detection processes
- Protein quantification using MS and profile reconstruction algorithm.

## • OPPORTUNITIES

- Early diagnosis
- The concept can be generalized to other cancers as well as to biomarker discovery.

## List of participants

- Atos Origin sae, Spain – ATOS
- Commissariat à l’Energie Atomique, France – CEA-LETI
- DIGILAB BIOVISION GmbH, Germany – DBVN
- Foundation for Research and Technology, Greece – FORTH
- University of Münster, Germany – WWU
- Swiss Institute of Bioinformatics, Switzerland – SIB
- Geneva Bioinformatics, Switzerland - GeneBIO

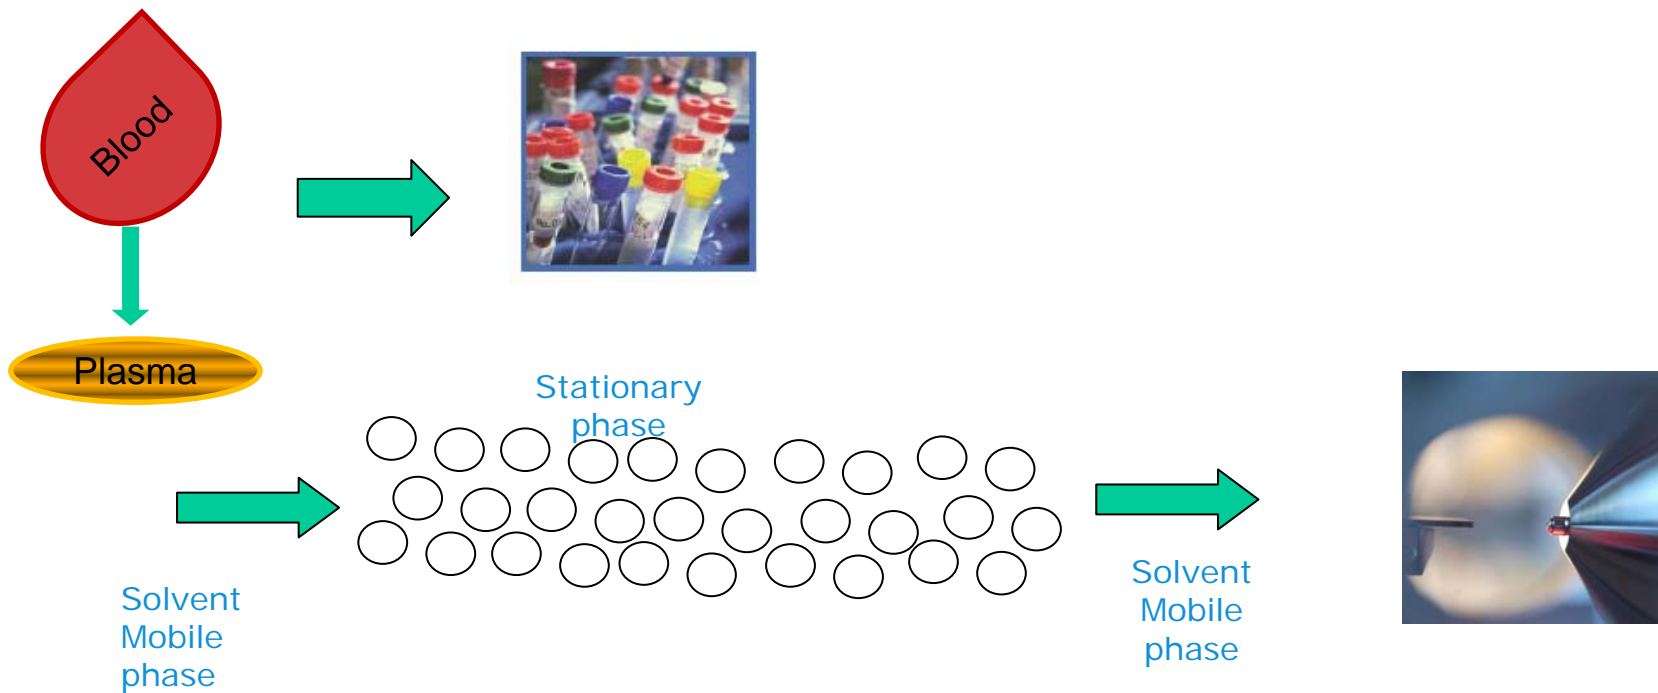

- **ATOS Origin:** Manuel M Pérez-Pérez, Blanca Jordán, José F. Esteban and Carmen Reina
- **CEA-LETI:** Pierre Grangeat, Laurent Gerfault, Françoise Vinet, Christine Peponnet, Florence Ricoul, Régis Guillemaud, Grégory Strubel, Caroline Paulus, Nicolas Sarrut and Emeline Mery
- **DBVN:** Harald Tammen, Karl Schorn and Michael Jurgen
- **FORTH:** Dimitris Kafetzopoulos, Manolis Tsiknakis, Sophie Kaforou, Hara Roumpaki, George Potamias, Haris Kondylakis, Manolis Kalaitz, Vangelis Kritsotakis
- **WWU:** Jürgen Schnekeburger, Verena Schick, Jasna Peter-Katalinic, Laura Bindila, Rainer Ossig
- **SIB:** Frederique Lisacek
- **GeneBIO:** Pierre Alain Binz

*Thank you*

*Thank you*

# LC –mobile phase– stationary phase

# Nano (I)

- Production of new digestion modules.
- Design of a new nano-liquid chromatography (LC) module including a new e-spray tip.
- New retention phase for chromatography module
